

Contact Run 1 - QC v1.8 / Full CET-R Exploratory Rerun

The Contact QC rerun succeeded. All three branches passed, all branch-level exogenous regressor frames were generated, and the error log is empty.

Exploratory CET-R result: the full v1.8 stimulus-side regressors do not explain away the Target-dominant NIP/CII pattern. Target remains greater than both Control and Override across every conceptual Contact anchor after pooled full-exogenous residualization.

Boundary: exploratory exogenous-regressor residualization only; not confirmatory, not OSM biology, not hidden-Y proof.

QC package status

Schema: PRAYCG_StimulusFingerprint_CET_EET_v1_8; version: 1.8; status: PASS; cue count: 99; anchor count: 0; merge rate: 4.0 Hz.

Interpretation and limitations

The v1.8 QC fix worked. The father/avatar recognition windows remain the strongest Target-specific residualized Contact windows. The late payload/terminal-release window also remains Target-dominant after residualization. Pensacola remains Target-dominant but weaker and more visually confounded.

The uploaded QC manifest reports anchor_count=0, so anchor-specific stimulus-rhythm vectors were not generated from a locked anchor JSON in this QC pass. The original Contact acquisition remains conceptually predeclared but not runner-registered.

StimulusFingerprint/CET outputs belong to exogenous input u(t), not biological hidden-Y. They test whether physiological/NIP/MRED/TTI effects are reducible to luminance, motion, audio envelope, cuts, cue rhythm, and start-pulse structure.
