

Contact Run 1 - MRED-ITP / ACG / OCU Deep Analysis v1.0

Executive verdict

The new information-thermodynamic proxy layer is useful but should remain exploratory. Contact shows some Target-aligned information-structure and ocular-release candidates, but the result is not a literal thermodynamic proof. Lempel-Ziv complexity is treated as a compressibility/diversity proxy, and Fp1 blink timing is treated as a rough ocular event-boundary proxy, not confirmed memory encoding.

Boundary

Information-thermodynamic proxy layer only. LZC is not literal thermodynamic entropy; Fp1 blink timing is not proof of memory encoding. No OSM biology or human EEG mechanism claim.

Data and streams

EEG stream `obci\_eeg1`: 270000 samples, 16 channels, nominal 125.0 Hz.

Blink-proxy events detected from Fp1: 157 total.

Phase-level complexity/blink summary

phase	duration_sec	mean_lz_complexity_proxy	blink_count	blink_rate_per_min
CONTROL_1	303.050	0.911	7	1.386
TARGET_1	300.505	0.936	3	0.599
CONTEXTUAL_OVERRIDE_1	300.440	0.891	5	0.999
BASELINE_1	120.003	0.890	31	15.500
WASHOUT_1	120.003	0.921	3	1.500
WASHOUT_2	120.004	0.938	1	0.500
WASHOUT_3	120.002	0.910	7	3.500
BASELINE_2_REFLECTION	120.003	0.916	2	1.000

Target anchor-level candidates

	5.665	-1.068	3.219	0.075
	0.475	1.058	-0.010	1.037
ough	1.334	2.137	0.504	1.562
	-3.854	-0.135	-1.169	0.000
	0.299	-0.620	0.984	0.000

Interpretation

- ACG asks whether anchor windows show a complexity perturbation followed by settlement. It does not estimate thermodynamic entropy directly.
- OCU asks whether blinks are suppressed near the meaningful window and released afterward. It is a blink-timing proxy; without EOG/eye tracking it remains tentative.
- MRED-ITP convergence is strongest when complexity settlement and ocular release both align with MRED/KHT-topo target events and show Target > Control/Override specificity.
- The Contact father/avatar recognition cluster remains the most important target candidate from prior modules; this new layer adds supportive/diagnostic context rather than replacing MRED, NIP, or TTI.

Strongest caution

The Fp1 channel is simultaneously a useful blink/ocular proxy and a possible EEG artifact source. Any blink-timed event must be treated as an ocular state marker, not as clean neural theta/gamma evidence in the same contaminated samples.
