

# PRAYCG MRED-Peak and MRED-Resolution Analysis

## Arrival Run 1, Contact Run 1, Field of Dreams Run 1

Contact is the cleanest MRED-Peak case. Field of Dreams is the cleanest MRED-Resolution case. Arrival remains recognition-dominant and theoretically useful, but does not pass strict peak or true-resolution endpoints with the available data.

## Definitions

MRED-Peak tests event-like meaning recognition plus delayed integration at an anchor. Strict status is inherited from existing A-MRED/BIT gates; candidate status requires Target MR, Target ENC, condition specificity, CII support, and soft artifact pass.

MRED-Resolution tests closure/recovery: moderate recognition plus post-event or Baseline2 regulatory/semantic echo. It requires Baseline2/RDI for true grading; otherwise the result is marked proxy-only.

## Run summary

## Interpretation by run

Arrival: Target-dominant recognition/immersion screens appear at conceptual anchors, especially reading-letters, but no strict event lock is present. Resolution is not graded because the older run lacks a PRAYCG2.0 final-reflection Baseline2 layer.

Contact: the father/avatar region remains the strongest MRED-Peak result. It has strict BIT support, high Target MR, high Target ENC, and high Target-specific CII. Its after-state is positive, but the best label is high-load-with-recovery rather than pure resolution.

Field of Dreams: one runner-time A-MRED peak pass remains timing-cautioned. Its strongest result is MRED-Resolution: Target-favoring self-report, Baseline2/recovery context, and NUPI resolution profile.

## Boundary

MRED-Peak and MRED-Resolution are endpoint-compression profiles. They do not prove memory formation, consciousness, OSM biology, or literal thermodynamic entropy reduction. Strict confirmation requires frame-verified locked anchors, clean ALS timing, artifact/CET-R gates, and replication.
