

Best 16-channel PR-AYC-G montage

If you are using OpenBCI Cyton + Daisy = 16 EEG channels, I would wire this:

Priority	Location	Role
1	Fz	frontal-midline control / analytic lock / task stance
2	Cz	central anchor / main midline stability
3	Pz	posterior-midline washout / integration
4	F3	left frontal control / analytic effort
5	F4	right frontal control / analytic effort
6	C3	left central sensorimotor / body-state coupling
7	C4	right central sensorimotor / body-state coupling
8	P3	left parietal meaning / integration
9	P4	right parietal meaning / integration
10	T5	left posterior temporal / narrative-social proxy
11	T6	right posterior temporal / narrative-social proxy
12	O1	left visual control
13	O2	right visual control
14	T3	left temporal / jaw-muscle sentinel
15	T4	right temporal / jaw-muscle sentinel
16	Fp1	blink / eye artifact sentinel

That is the best practical balance.

Fp1 is not there because it is a clean brain endpoint. It is there to catch blinks.

I would exclude Fp2, F7, and F8 from the first 16-channel PR-AYC-G montage unless you have more channels.
